

The above figure spans from 2013 and 2022 and it shows fatal encounter with a police in United States of America (USA). As it is shown in the figure the first order is suggestive of an increasing fatal encounter with a police over the years. Comparing the percentage difference in total number of deaths by police, from 2013 to 2021 there is an increment of 6.5% (76 deaths). 2021 shows the highest death numbers (1159) compared to the previous years. From these total deaths 24% are attributed to communities of color, yet the 2020 census shows this community was only on 15% of the entire population. This might imply excess risk for this community group. Furthermore, when adjusting for population differences, Black people face a significantly higher risk of fatal police shootings compared to other racial groups. Specifically, they face 2.9 times more risk, which highlights the need for continued efforts to address and eradicate racial biases and disparities within law enforcement agencies.
